

Brine Make-up & Storage Systems

## READY-to-GO BRINERS

The reality is that immediate needs arise and sometimes our standard lead times simply aren't good enough to satisfy those needs. In response, we now inventory one **NSF-61** certified 35 ton RTG poly briner at all times. (When the RTG briner is ordered, its replacement is immediately put into production) We settled on our 35 ton briner because it is our most popular size (by a lot). It will enable most users to keep up with their brine production requirements and at the same time take advantage of the economies of truckload bulk deliveries (25 tons).

Our 35 ton RTG includes everything you will need to quickly and easily take your first bulk salt delivery and immediately begin producing saturated brine. You can view the CAD drawing at [this link](#).

Additionally, our full menu of options is available for shipment with your briner (with the exception of our Freeze Protection System). These options include Water Level Indication and Control, Salt Level Indication, Brine Concentration Monitoring System, Access Ladder, Seismic and Wind Restraint, complete Expansion Joint Assemblies, Dust Bag Housing and Spare Dust Bags.

### When You Need it Now, We're READY-to-GO

Our 35 ton RTG unit has a 10'  $\emptyset$  footprint and is 16' tall + the salt fill line. Salt is pneumatically loaded via a 4" SS fill line which has a quick connect for standard hose connection. If bulk salt is not available in your area and you plan on loading the briner with bulk bags, the standard manway cover is an ideal location into which you can unload the bags. Let us know how we can assist you with your saturated brine production requirements.
