

Brine Make-up & Storage Systems

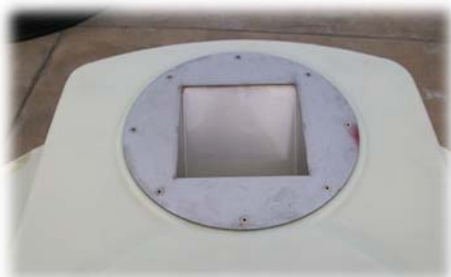

## Bulk Bag Loaded Briners

**The Challenges:** Many regions do not have the benefit of 25 ton pneumatically offloaded salt deliveries. In those regions, and when salt consumption warrants it, salt is supplied in one ton bulk bags. Bulk bags can be handled in a variety of methods including being dumped directly into the briner while being suspended by a forklift or discharge frame. The bulk bag can also be offloaded into a hopper and then delivered to the briner by screw or pneumatic conveyor. We incorporate all of the features necessary to reliably and consistently deliver saturated brine to your process with our Bulk Bag Loaded Briners.

**The Solution:** BrineMaker has designed and delivered our Bulk Bag Loaded Briners for use worldwide. Applications include pilot testing in the geothermal industry, nut seasoning, fish processing, water softening, dye houses, and many others. Just like bulk briners, our objective with the Bulk Bag Loaded Briner is to deliver the required volume of saturated brine, when you need it. This is accomplished by taking the time to thoroughly understand your needs, application of brine making principals, then taking a common sense approach to arrive at a high-value solution. Very often, that solution is a low profile vessel that is loaded from a bag being suspended from a forklift and an Operator Safety Platform, which positions the operator to safely “drop” the contents of the bulk bag into the briner.

We will evaluate a variety of features and configurations to provide you with a high-performance and high-value solution.
